

项目报告书

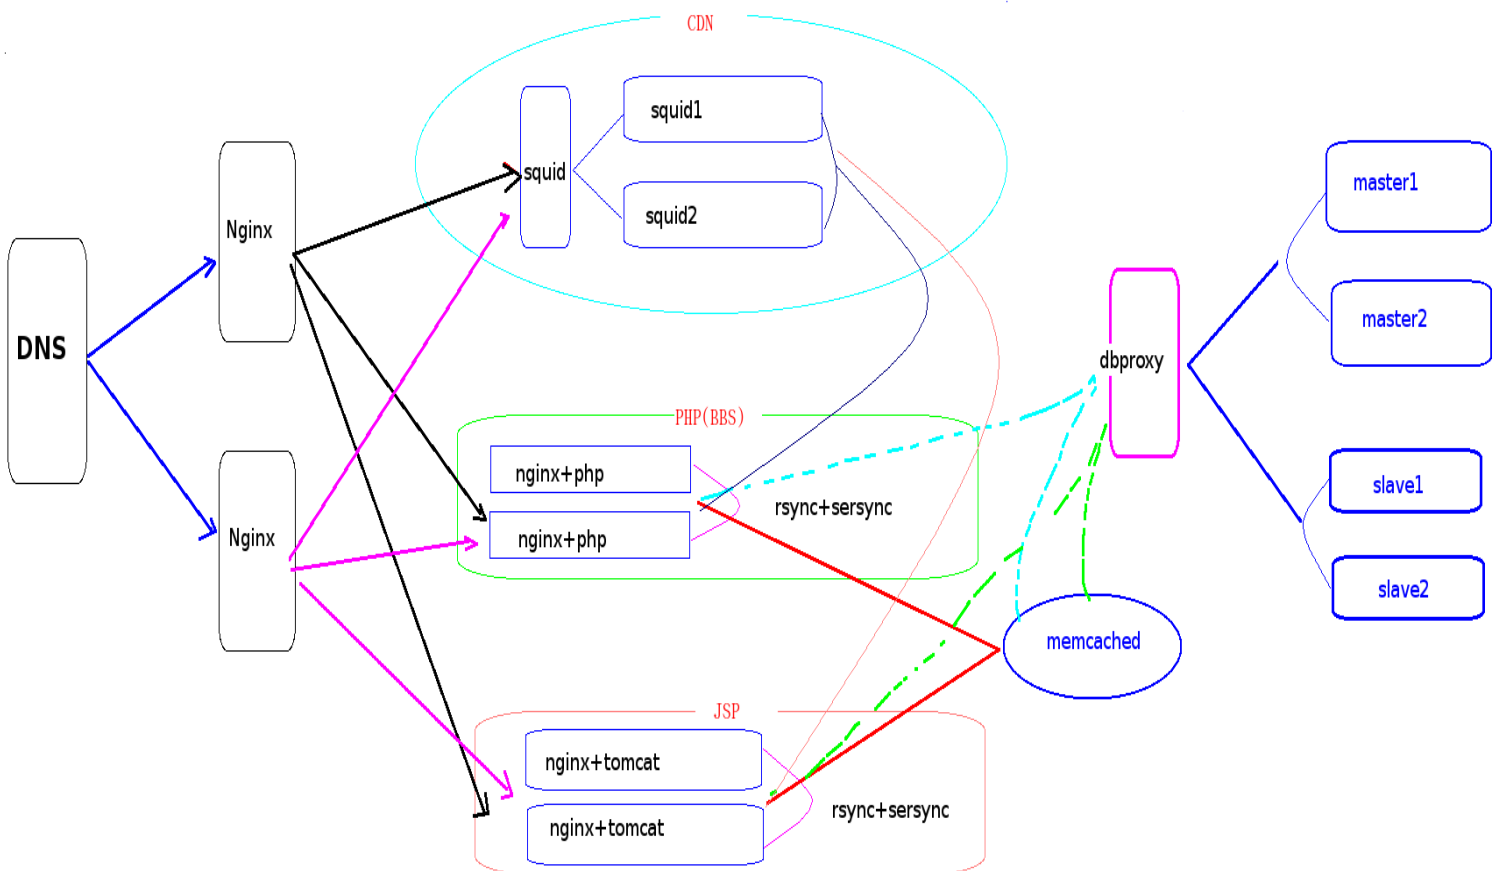

林燕妮 谭小梅 陈彬

摘要：本文详细的阐述了高伸缩高可用大并发的网络架构的搭建。运用了 MySQL- Proxy 架构，Nginx+Php 集群架构，Nginx+Tomcat 集群架构，内容分发网络（CDN）架构，Nginx 的七层调度，Memcached 缓存技术以及 Rsync+sersync 等一系列服务成功的完成了该网络架构的搭建。

项目思路：

- 1) 搭建 pxe 批量安装系统
- 2) 安装后端数据库实现 mysql 读写分离与主从复制
- 3) 安装 nginx+php+memcache/redis(php 论坛) www.php-f20.com
- 4) 安装 nginx+tomcat+jdk+jsp+memcache(jsp 企业网站) www.jsp-f20.com
- 5) 安装 servsync 实现页面一致性的发布
- 6) 安装 nginx 反向代理服务器(调度器)实现负载均衡(轮循)
- 7) 安装 squid 实现静态缓存加速 (CDN)
- 8) 安装 nginx 反向代理服务器(双机互备)
- 9) 通过 DNS 轮循访问 2 台 nginx 调度器

总的拓扑图：

实验环境准备：

一、安装系统

系统版本: rhel7.1

镜像格式: qcow2

磁盘 size: 20G

磁盘 bus: virtio

网卡 model: virtio

二、IP 规划

DNS 轮询 1 台 172.25.254.21

Nginx 反向代理(调度) 2 台

nginx-001 172.25.21.10

nginx-002 172.25.21.11

Squid 静态缓存加速器 2 台

squid-001 172.25.21.12

squid-002 172.25.21.13

PHP 论坛: www.php-fX.com 2 台

nginx1+php1 172.25.20.14

\

sync+sersync(Discuz) 页面数据一致性 192.168.0.9

/

nginx2+php2 172.25.20.15

JSP 门户网站: www.jsp-fX.com 2 台

nginx1+tomcat1 172.25.20.16

\

sync+sersync(ejforum) 页面数据一致性 192.168.0.9

/

nginx1+tomcat1 172.25.20.17

memcached 数据库缓存加速器，保证 session 一致性 1 台 172.25.20.18

数据库:

mariadb-server 172.25.254.22

主从复制/读写分离

172.25.22.16 172.25.22.18

/ master1(rw) ---- slave1(r)

dbproxy(读写分离)

172.25.22.15 \ master2(rw) ---- slave2(r)

172.25.22.17 172.25.22.19

三、推送密钥对,关闭所有节点的防火墙与 selinux

ssh-keygen

```
# for i in {20..22}
```

```
> do
```

```
> ssh-copy-id root@172.25.254.$i
```

```
> done
```

```
# for i in {14..18}
```

```
> do
```

```
> ssh-copy-id root@172.25.20.$i
```

```
> done
```

```
ssh-copy-id root@172.25.20.9
```

```
# for i in {10..13}
```

```
> do
```

```
> ssh-copy-id root@172.25.21.$i
```

```
> done
```

```
# for i in {15..19}
```

```
> do
```

```
> ssh-copy-id root@172.25.22.$i
```

```
> done
```

```
# for i in {20..22}
```

```
> do
```

```
> ssh root@172.25.254.$i "sed -i 's/^SELINUX=.*SELINUX=disabled/' /etc/selinux/config;setenforce 0 ; iptables -F"
```

```
> done
```

```
# for i in {20..22}
```

```
> do
```

```
> ssh root@172.25.254.$i "sed -i 's/^SELINUX=.*SELINUX=disabled/' /etc/selinux/config;setenforce 0 ; iptables -F"
```

```
> done
```

```
# for i in {14..18}
```

```
> do
```

```
> ssh root@172.25.20.$i "sed -i 's/^SELINUX=.*SELINUX=disabled/' /etc/selinux/config;setenforce 0 ; iptables -F"
```

```
> done
```

```
ssh root@172.25.20.9 "sed -i 's/^SELINUX=.*SELINUX=disabled/' /etc/selinux/config;setenforce 0 ; iptables -F"
```

```
# for i in {10..13}
```

```
> do
```

```
> ssh root@172.25.21.$i "sed -i 's/^SELINUX=.*SELINUX=disabled/' /etc/selinux/config;setenforce 0 ; iptables -F"
```

```
> done
```

```
# for i in {15..19}
> do
> ssh root@172.25.22.$i "sed -i 's/^SELINUX=.*SELINUX=disabled/' /etc/selinux/config;setenforce
0 ; iptables -F"
> done
```

一、搭建 mysql 数据库

172.25.254.22

1、安装数据库

```
[root@foundation1 ~]# yum -y install mariadb-server mariadb
[root@foundation1 ~]# systemctl start mariadb
[root@foundation1 ~]# systemctl enable mariadb
```

2、初始化数据库

```
MariaDB [(none)]> delete from mysql.user where user="";
MariaDB [(none)]> update mysql.user set password=password('uplooking') where user='root';
MariaDB [(none)]> flush privileges;
```

3、新建 BBS 论坛 JSP 网站库

```
MariaDB [(none)]> create database bbs default charset utf8;
MariaDB [(none)]> create database jsp default charset utf8;
```

```
MariaDB [(none)]> grant all on bbs.* to runbbs@%' identified by '123456';
MariaDB [(none)]> grant all on jsp.* to runjsp@%' identified by '123456';
MariaDB [(none)]> flush privileges;
```

二、采用 LNMP 架构，搭建 BBS 论坛

LNMP1 172.25.20.14

LNMP2 172.25.20.15

1、安装 lnp+spawn-fcgi

```
# yum -y install php php-mysql
# rpm -ivh ftp://172.25.254.250/notes/project/UP200/UP200_nginx-master/pkg/nginx-1.8.1-
1.el7ngx.x86_64.rpm
# rpm -ivh ftp://172.25.254.250/notes/project/UP200/UP200_nginx-master/pkg/spawn-fcgi-1.6.3-
5.el7.x86_64.rpm
```

2、配置虚拟主机

```
# cp /etc/nginx/nginx.conf /etc/nginx/nginx.conf.back
# cat /etc/nginx/nginx.conf
user nginx;
worker_processes 2;
error_log /var/log/nginx/error.log warn;
```

```

pid        /var/run/nginx.pid;
events {
    use epoll;
    worker_connections 1024;
}

http {
    include      /etc/nginx/mime.types;
    default_type application/octet-stream;
    log_format  main  '$remote_addr - $remote_user [$time_local] "$request" '
                      '$status $body_bytes_sent "$http_referer" '
                      '"$http_user_agent" "$http_x_forwarded_for"';
    access_log  /var/log/nginx/access.log  main;
    sendfile    on;
    tcp_nopush  on;
    keepalive_timeout 65;
    gzip  on;
    include /etc/nginx/conf.d/*.conf;
}

# cat > /etc/nginx/conf.d/www.php-f20.com.conf << EOT

server {
    listen 80;
    server_name www.php-f20.com;
    root /usr/share/nginx/php-f20.com;
    index index.php index.html index.htm;
    location ~ /\.php$ {
        fastcgi_pass 127.0.0.1:9000;
        fastcgi_index index.php;
        fastcgi_param SCRIPT_FILENAME /usr/share/nginx/php-f20.com$fastcgi_script_name;
        include fastcgi_params;
    }
}
EOT

```

3、配置 php 服务(spawn-fcgi)

```

# vim /etc/sysconfig/spawn-fcgi
OPTIONS="-u nginx -g nginx -p 9000 -C 32 -F 1 -P /var/run/spawn-fcgi.pid -- /usr/bin/php-cgi"
# systemctl start spawn-fcgi
# systemctl enable spawn-fcgi
# netstat -tnlp |grep :9000
tcp        0      0 0.0.0.0:9000          0.0.0.0:*            LISTEN     24248/php-cgi

# systemctl start nginx
# systemctl enable nginx
# netstat -tnlp |grep :80

```

```
tcp    0    0 0.0.0.0:80          0.0.0.0:*          LISTEN  1362/nginx: master
```

4、安装 Discuz 网页

```
# lftp 172.25.254.250:/notes/project/software/lnmp
lftp 172.25.254.250:/notes/project/software/lnmp> get Discuz_X3.1_SC_UTF8.zip
# cp Discuz_X3.1_SC_UTF8.zip /tmp/
# cd /tmp
# unzip Discuz_X3.1_SC_UTF8.zip
# cp -r upload/* /usr/share/nginx/php-f20.com/
# chown nginx. /usr/share/nginx/php-f20.com/ -R
# systemctl restart spawn-fcgi
# systemctl restart nginx
```

测试：

```
[root@foundation20 ~]# vim /etc/hosts
172.25.20.14    www.php-f20.com
http://www.php-f20.com/install/
```

填写数据库信息：

数据库服务器: 172.25.254.20
数据库名: bbs
数据库用户名: runbbs
数据库密码: 123456

5、将 172.25.20.14 的数据同步到 172.25.20.15 节点

安装软件：

```
[root@serverf ~]# yum -y install php php-mysql
[root@serverf ~]# rpm -ivh ftp://172.25.254.250/notes/project/UP200/UP200_nginx-master/pkg/nginx-1.8.1-1.el7ngx.x86_64.rpm
[root@serverf ~]# rpm -ivh ftp://172.25.254.250/notes/project/UP200/UP200_nginx-master/pkg/spawn-fcgi-1.6.3-5.el7.x86_64.rpm
```

同步 nginx 配置文件

```
[root@server ~]# rsync -avzR /etc/nginx/ 172.25.20.15:/
```

同步 php 配置文件

```
[root@server ~]# rsync -avzR /etc/sysconfig/spawn-fcgi 172.25.20.15:/
```

同步 Discuz 论坛

```
[root@server php-f20.com]# rsync -avzR /usr/share/nginx/php-f20.com/ 172.25.20.15:/
```

三、采用 nginx+tomcat 搭建 JSP 网站

nginx+tomcat1 172.25.20.16
nginx+tomcat2 172.25.20.17

1、下载 jdk 与 tomcat

```
# yum -y install lftp
# lftp 172.25.254.250:/notes/project/UP200/UP200_tomcat-master
```

```
lftp 172.25.254.250:/notes/project/UP200/UP200_tomcat-master> mirror pkg/
lftp 172.25.254.250:/notes/project/UP200/UP200_tomcat-master> exit
# cd pkg/
# tar xf jdk-7u15-linux-x64.tar.gz -C /opt/
# mv /opt/jdk1.7.0_15/ /opt/java
# mkdir /usr/local/tomcat
# tar -xf apache-tomcat-8.0.24.tar.gz -C /usr/local/tomcat
```

2、以 jsvc 的方式启动:

```
# groupadd -g 888 tomcat
# useradd -g 888 -u 888 tomcat -s /sbin/nologin
# cd /usr/local/tomcat/apache-tomcat-8.0.24/bin/
# tar -xf commons-daemon-native.tar.gz
# cd commons-daemon-1.0.15-native-src/unix/
]# yum -y install gcc
# ./configure --with-java=/opt/java
# make
# cp -a jsvc /usr/local/tomcat/apache-tomcat-8.0.24/bin/
```

3、优化 tomcat 命令，jsvc 的方式启动实际执行的脚本为 bin 目录下的 daemon.sh

```
# cd /usr/local/tomcat/apache-tomcat-8.0.24/bin/
# cp daemon.sh /etc/init.d/tomcat
# vim /etc/init.d/tomcat
# chkconfig: 2345 30 20
CATALINA_HOME=/usr/local/tomcat/apache-tomcat-8.0.24
CATALINA_BASE=/usr/local/tomcat/apache-tomcat-8.0.24
JAVA_HOME=/opt/java/
# chmod +x /etc/init.d/tomcat
# chkconfig --add tomcat

# chown tomcat.tomcat -R /usr/local/tomcat/apache-tomcat-8.0.24/
# service tomcat start
# ps aux |grep tomcat
root    2395  0.0  0.0 10660  356 ?        Ss   05:15   0:00 jsvc.exec
tomcat  2396 44.4 13.5 1326012 67976 ?        Sl   05:15   0:04 jsvc.exec
```

```
# netstat -tnlp |grep :80
tcp6     0      0 :::8009          :::*              LISTEN      2416/jsvc.exec
tcp6     0      0 :::8080          :::*              LISTEN      2416/jsvc.exec
```

4、配置虚拟主机: www.jsp-f20.com

```
# vim /usr/local/tomcat/apache-tomcat-8.0.24/conf/server.xml
<Host name="www.jsp-f20.com" appBase="jsp-f20.com"
    unpackWARs="true" autoDeploy="true">
    <Valve className="org.apache.catalina.valves.AccessLogValve" directory="logs"
        prefix="jsp-f20.com_access_log" suffix=".txt"
        pattern="%h %l %u %t &quot;%r&quot; %s %b" />
</Host>
```

测试：

```
[root@serverg jsp-f20.com]# pwd
/usr/local/tomcat/apache-tomcat-8.0.24/jsp-f20.com
[root@serverg jsp-f20.com]# mkdir ROOT
[root@serverg jsp-f20.com]# echo hello > ROOT/index.jsp
```

```
[root@foundation20 ~]# elinks http://www.jsp-f20.com:8080 -dump
hello
```

5、将网页文件放置网站根目录下

```
# cp ejforum-2.3.zip /tmp
# cd /home/tomcat/apache-tomcat-8.0.24/jsp-f20.com/
# mkdir ROOT
# unzip ejforum-2.3.zip
# cp ejforum-2.3/ejforum/* -r /usr/local/tomcat/apache-tomcat-8.0.24/jsp-f20.com/ROOT/
```

6、配置和数据库的连接

```
# cd pkg/
# tar xf mysql-connector-java-5.1.36.tar.gz -C /tmp/
# cp /tmp/mysql-connector-java-5.1.36/mysql-connector-java-5.1.36-bin.jar /usr/local/tomcat/apache-tomcat-8.0.24/lib/

# vim /usr/local/tomcat/apache-tomcat-8.0.24/jsp-f20.com/ROOT/WEB-INF/conf/config.xml
    <database maxActive="10" maxIdle="10" minIdle="2" maxWait="10000"
        username="runjsp" password="123456"
        driverClassName="com.mysql.jdbc.Driver"
        url="jdbc:mysql://172.25.254.20:3306/jsp?
characterEncoding=gbk&autoReconnect=true&autoReconnectForPools=true&zeroDate
TimeBehavior=convertToNull"
        sqlAdapter="sql.MySqlAdapter"/>
```

7、远程导入数据库表结构

```
# wget ftp://172.25.254.250/notes/project/software/tomcat/ejforum-2.3.zip
# unzip ejforum-2.3.zip -d /tmp/
# cd /tmp/ejforum-2.3/install/script/
# yum -y install mariadb
# mysql -urunjsp -p123456 jsp -h172.25.254.20 < easyjforum_mysql.sql
```

8、修改权限

```
# chown tomcat.tomcat -R /usr/local/tomcat/apache-tomcat-8.0.24/
# service tomcat stop
# service tomcat start
```

测试:

修改 host 文件解析

```
# vim /etc/hosts
```

```
172.25.20.16 www.jsp-f20.com
```

访问：<http://www.jsp-f20.com:8080>

8、配置 nginx 虚拟主机，实现动静分离

通过 nginx 处理静态数据，让用户访问 80 默认端口：

```
# rpm -ivh ftp://172.25.254.250/notes/project/UP200/UP200_nginx-master/pkg/nginx-1.8.1-1.el7ngx.x86_64.rpm
```

```
# cat /etc/nginx/nginx.conf
```

```
user nginx;
```

```
worker_processes 1;
```

```
error_log /var/log/nginx/error.log warn;
```

```
pid /var/run/nginx.pid;
```

```
events {
```

```
    worker_connections 1024;
```

```
}
```

```
http {
```

```
    include /etc/nginx/mime.types;
```

```
    default_type application/octet-stream;
```

```
    log_format main '$remote_addr - $remote_user [$time_local] "$request" '
        '$status $body_bytes_sent "$http_referer" '
        '"$http_user_agent" "$http_x_forwarded_for";
```

```
    access_log /var/log/nginx/access.log main;
```

```
    sendfile on;
```

```
    #tcp_nopush on;README
```

```
    keepalive_timeout 65;
```

```
    #gzip on;
```

```
    upstream java_upstream {
```

```
        server 127.0.0.1:8080 max_fails=2 fail_timeout=30s;
```

```
    }
```

```
    include /etc/nginx/conf.d/*.conf;
```

```
}
```

```
# vim /etc/nginx/conf.d/www.jsp-f20.com.conf
```

```
server {
```

```
    listen 80;
```

```
    server_name www.jsp-f20.com;
```

```
    location / {
```

```
        root /usr/local/tomcat/apache-tomcat-8.0.24/jsp-f20.com/ROOT;
```

```
        index index.jsp index.html index.htm;
```

```
    }
```

```
    location ~ /\.jsp.* {
```

```
        proxy_set_header Host $host;
        proxy_set_header X-Forward-For $remote_addr;
        proxy_pass http://java_upstream;
    }
}
```

```
# nginx -t
nginx: the configuration file /etc/nginx/nginx.conf syntax is ok
nginx: configuration file /etc/nginx/nginx.conf test is successful
```

```
# systemctl start nginx
# systemctl enable nginx
```

9、将 tomcat1+nginx1 同步到 tomcat2+nginx2

```
# service tomcat stop
# systemctl stop nginx
```

```
# rsync -avzR /opt/java/ root@172.25.20.17:/
# rsync -avzR /usr/local/tomcat/ root@172.25.20.17:/
# rsync -avzR /etc/rc.d/init.d/tomcat root@172.25.20.17:/
# rsync -avzR /etc/nginx/ root@172.25.20.17:/
```

10、启动 tomcat 服务

先启动 tomcat1

```
# service tomcat start
# systemctl start nginx
```

再启动 tomcat2

安装 nginx

```
# rpm -ivh ftp://172.25.254.250/notes/project/UP200/UP200_nginx-master/pkg/nginx-1.8.1-1.el7ngx.x86_64.rpm
```

```
# groupadd -g 888 tomcat
# useradd -u 888 -g 888 -s /sbin/nologin tomcat
```

```
# service tomcat start
# service nginx start
# systemctl start nginx
# systemctl enable nginx
```

测试: 修改 hosts 文件

```
[root@foundation20 ~]# vim /etc/hosts
172.25.20.17 www.jsp-f20.com
```

访问 : <http://www.jsp-f20.com>

四、rsync+sersync 共享存储

实例 1:nginx+php

客户端 : 192.168.0.9

webserver1:192.168.0.14

webserver2:192.168.0.15

1、在 webserver1 上配置 rsync

```
# yum -y install rsync
```

```
# cat > /etc/rsyncd.conf << EOT
```

```
uid=nginx
```

```
gid=nginx
```

```
use chroot=yes
```

```
address=192.168.0.14
```

```
port=873
```

```
max connections = 3
```

```
log file=/var/log/rsyncd.log
```

```
pid file=/var/run/rsyncd.pid
```

```
transfer logging = yes
```

```
timeout = 900
```

```
host allow=192.168.0.0/24
```

```
dont compress = *.gz *.tgz *.zip *.z *.Z *.rpm *.deb *.bz2 *.iso
```

```
[webshare]
```

```
path =/usr/share/nginx/php-f20.com
```

```
comment = www.php-f20.com html page
```

```
read only = no
```

```
auth users=user01 user02
```

```
secrets file=/etc/rsyncd_user.db
```

```
EOT
```

创建 rsync 同步密码文件,并设置权限为 600

```
cat > /etc/rsyncd_user.db << BOT
```

```
user01:123
```

```
user02:456
```

```
BOT
```

```
# chmod 600 /etc/rsyncd_user.db
```

启动守护进程,并写入开机自启动

```
# echo "/usr/bin/rsync --daemon" >> /etc/rc.local
```

```
# chmod +x /etc/rc.d/rc.local
```

```
# pkill -9 rsync ; rm -fr /var/run/rsyncd.pid
```

```
# source /etc/rc.local
```

```
# rsync --daemon
```

```
# netstat -tnlp |grep :873
```

```
tcp      0      0 0.0.0.0:873          0.0.0.0:*        LISTEN   3609/rsync
```

```
tcp6     0      0 :::873              :::*              LISTEN   3609/rsync
```

2、将相关配置文件同步到 webserver2

```
[root@server ~]# rsync -avzR /etc/rsyncd.conf /etc/rsyncd_user.db /webshare/ root@192.168.0.15:/
启动 rsync
[root@serverf ~]# rsync -daemon
[root@serverf ~]# echo 456 > /etc/rsyncd1.pass
[root@serverf ~]# rsync -avz --password-file=/etc/rsyncd1.pass /root/test.html
user02@192.168.0.16::webshare
```

3、在客户端配置 sersync

安装 sersync

```
# wget ftp://172.25.254.250/notes/project/software/sersync2.5.4_64bit_binary_stable_final.tar.gz
# tar xf sersync2.5.4_64bit_binary_stable_final.tar.gz -C /opt/
# mv /opt/GNU-Linux-x86 /opt/sersync
```

配置 sersync

```
# cat > /opt/sersync/php_confxml.xml << EOF
<?xml version="1.0" encoding="ISO-8859-1"?>
<head version="2.5">
  <host hostip="localhost" port="8008"></host>

</head>
EOF

```

创建本地同步目录

```

# mkdir /usr/share/nginx/php-f20.com/ -p
# rsync -avzR 192.168.0.14:/usr/share/nginx/php-f20.com/ /

```

```

# rsync -v 192.168.0.14::
webshare      www.php-f20.com html page
# rsync -v 192.168.0.15::
webshare      www.php-f20.com html page

```

```
# echo 123 > /etc/rsyncd.pass
# chmod 600 /etc/rsyncd.pass
```

开启 sersync 守护进程同步数据

```
# /opt/sersync/sersync2 -d -r -n 12 -o /opt/sersync/php_confxml.xml
```

实例 2:nginx+tomcat

客户端 : 192.168.0.9

      <ssh start="false"/>  
    </rsync>  
    <failLog path="/tmp/rsync_fail_log.sh" timeToExecute="60"/><!--default every 60mins  
execute once-->  
    <crontab start="false" schedule="600"/><!--600mins-->  
    <crontabfilter start="false">  
      <exclude expression="*.php"></exclude>
```

```

        <exclude expression="info/*"></exclude>
    </crontabfilter>
</crontab>
<plugin start="false" name="command"/>
</sersync>

<plugin name="command">
    <param prefix="/bin/sh" suffix="" ignoreError="true"/>    <!--prefix /opt/tongbu/mmm.sh
suffix-->
    <filter start="false">
        <include expression="(.*).php"/>
        <include expression="(.*).sh"/>
    </filter>
</plugin>

<plugin name="socket">
    <localpath watch="/opt/tongbu">
        <deshost ip="192.168.138.20" port="8009"/>
    </localpath>
</plugin>
<plugin name="refreshCDN">
    <localpath watch="/data0/htdocs/cms.xoyo.com/site/">
        <cdninfo domainname="ccms.chinacache.com" port="80" username="xxxx"
passwd="xxxx"/>
        <sendurl base="http://pic.xoyo.com/cms"/>
        <regexurl regex="false" match="cms.xoyo.com/site([a-zA-Z0-9]*).xoyo.com/images"/>
    </localpath>
</plugin>
</head>

```

```

# echo 456 > /etc/rsyncd1.pass
# chmod 600 /etc/rsyncd1.pass

```

开启 sersync 守护进程同步数据

```
# /opt/sersync/sersync2 -d -n 12 -o /opt/sersync/jsp_confxml.xml
```

五、安装内存缓存服务器 memcached

172.25.20.18

memcached+tomcat 实现 session 一致

1、安装软件

```

[root@server1 ~]# yum -y install memcached
[root@server1 ~]# systemctl start memcached
[root@server1 ~]# systemctl enable memcached

```

2、上传 memcached 的 jar 文件到 tomcat1

```
[root@serverg ~]# lftp 172.25.254.250:/notes/project/software/tomcat_soft> mirror msm/
```

```
[root@serverg ~]# cp msm/* /usr/local/tomcat/apache-tomcat-8.0.24/lib/
```

```
[root@serverg ~]# vim /usr/local/tomcat/apache-tomcat-8.0.24/conf/context.xml
```

```
<?xml version='1.0' encoding='utf-8'?>
<Context>
<WatchedResource>WEB-INF/web.xml</WatchedResource>
<WatchedResource>${catalina.base}/conf/web.xml</WatchedResource>
<Manager className="de.javakaffee.web.msm.MemcachedBackupSessionManager"
memcachedNodes="n1:172.25.20.18:11211"
lockingMode="auto"
sticky="false"
requestUriIgnorePattern= ".*\.(png|gif|jpg|css|js)$"
sessionBackupAsync= "false"
sessionBackupTimeout= "100"
copyCollectionsForSerialization="true"
transcoderFactoryClass="de.javakaffee.web.msm.serializer.kryo.KryoTranscoderFactory" />
</Context>
```

```
[root@serverg ~]# service tomcat stop
```

```
[root@serverg ~]# service tomcat start
```

测试页面:

```
[root@serverg ~]# vim /usr/local/tomcat/apache-tomcat-8.0.24/jsp-f20.com/ROOT/test.jsp
```

```
<html>
<body bgcolor="red">
<center>
<%out.print(request.getSession().getId());%>
<h1>Tomcat</h1>
</body>
</html>
```

3、将修改的内容同步到 tomcat2

```
[root@serverg ~]# scp msm/* 172.25.20.17:/usr/local/tomcat/apache-tomcat-8.0.24/lib/
```

```
[root@serverg ~]# rsync -avzR /usr/local/tomcat/apache-tomcat-8.0.24/conf/context.xml
```

```
root@172.25.20.17:/
```

```
[root@serverg ~]# ssh root@172.25.20.17 "service tomcat stop && service tomcat start"
```

测试页面:

```
[root@serverg ~]# vim /usr/local/tomcat/apache-tomcat-8.0.24/jsp-f20.com/ROOT/test.jsp
```

```
<html>
<body bgcolor="blue">
<center>
<%out.print(request.getSession().getId());%>
<h1>Tomcat</h1>
</body>
</html>
```

六、引入 CDN 内容分发网络，实现网站静态元素加速

CDN 的全称是 Content Delivery Network，即内容分发网络。其目的是通过在现有的 Internet 中增加一层新的网络架构，将网站的内容发布到最接近用户的网络"边缘"，使用户可以就近取得所需的内容，解决 Internet 网络拥塞状况，提高用户访问网站的响应速度。

```
squid1 172.25.21.12
```

```
squid2 172.25.21.13
```

1、在 squid1 和 squid2 安装 squid

```
# yum -y install squid
```

2、配置 squid1

```
# vim /etc/squid/squid.conf
```

```
http_access allow all
```

```
http_port 3128 accel vhost vport
```

```
cache_dir ufs /var/spool/squid 256 16 256
```

```
cache_peer 172.25.20.14 parent 80 0 no-query originserver name=web1
```

```
cache_peer 172.25.20.15 parent 80 0 no-query originserver name=web2
```

```
cache_peer 172.25.20.16 parent 80 0 no-query originserver name=web3
```

```
cache_peer 172.25.20.17 parent 80 0 no-query originserver name=web4
```

```
cache_peer_domain web1 www.php-f20.com
```

```
cache_peer_domain web2 www.php-f20.com
```

```
cache_peer_domain web1 172.25.20.14
```

```
cache_peer_domain web2 172.25.20.15
```

```
cache_peer_domain web3 www.jsp-f20.com
```

```
cache_peer_domain web4 www.jsp-f20.com
```

```
cache_peer_domain web3 172.25.20.16
```

```
cache_peer_domain web4 172.25.20.17
```

```
# systemctl restart squid
```

```
# netstat -tnpl |grep squid
```

测试 squid1 代理

在测试机上修改相应的配置文件

```
# vim /etc/hosts
```

```
172.25.21.12 www.php-f20.com
```

```
172.25.21.12 www.jsp-f20.com
```

squid1 的测试结果

```
# curl -I http://www.php-f20.com:3128/static/image/common/formlink.gif
```

```
HTTP/1.1 200 OK
```

```
Server: nginx/1.8.1
```

```
Date: Thu, 28 Sep 2017 12:35:24 GMT
```

```
Content-Type: image/gif
```

```
Content-Length: 170
```

```

Connection: keep-alive

3、远程部属 squid2

```
# ssh root@172.25.21.13 "yum -y install squid"
# rsync -avzR /etc/squid/squid.conf root@172.25.21.13:/
# ssh root@172.25.21.13 "service squid start"
```

测试 squid2 代理

```
# vim /etc/hosts
172.25.21.13 www.php-f20.com
172.25.21.13 www.jsp-f20.com
```

squid2 的测试结果

```

Connection: keep-alive

七、利用 nginx 七层分发器实现基于内容的分发

如果是静态数据 通过调度器 squid_upstream 轮询
如果是 PHP 动态数据 通过调度器 php_upstream 轮询
如果是 JSP 动态数据 通过调度器 jsp_upstream 轮询
nginx1 172.25.21.10
nginx2 172.25.21.11

1、在 nginx1 调度器上增加 squid 的分发

```
# vim /etc/nginx/nginx.conf
upstream squid_upstream {
    server 172.25.21.12:3128 weight=1 max_fails=2 fail_timeout=1s;
    server 172.25.21.13:3128 weight=1 max_fails=2 fail_timeout=1s;
}

upstream php_upstream {
    server 172.25.20.14:80 weight=1 max_fails=2 fail_timeout=1s;
    server 172.25.20.15:80 weight=1 max_fails=2 fail_timeout=1s;
}

upstream jsp_upstream {
    server 172.25.20.16:8080 weight=1 max_fails=2 fail_timeout=1s;
    server 172.25.20.17:8080 weight=1 max_fails=2 fail_timeout=1s;
}

# vim /etc/nginx/conf.d/default.conf
server {
    listen    80;
```

```

server_name 127.0.0.1;
    location / {
        index index.php index.jsp index.html index.htm;
        proxy_pass http://squid_upstream;
        proxy_set_header Host $host;
        proxy_set_header X-Forwarded-For $remote_addr;
    }
    location ~ .*\.php$ {
        proxy_pass http://php_upstream;
        proxy_set_header Host $host;
        proxy_set_header X-Forwarded-For $remote_addr;
    }

    location ~ .*\.jsp$ {
        proxy_pass http://jsp_upstream;
        proxy_set_header Host $host;
        proxy_set_header X-Forwarded-For $remote_addr;
    }
}
# systemctl restart nginx

```

2、将配置文件同步 nginx2:

```

# rsync -avzR /etc/nginx/ 172.25.21.11:/
# ssh root@172.25.21.11 "service nginx restart"
# systemctl restart nginx

```

测试：

```

# vim /etc/hosts
172.25.21.10 www.jsp-f20.com
172.25.21.11 www.php-f20.com

```

直接访问，看到完整页面

关闭 squid，则访问不了静态页面

八、利用智能 DNS 实现大并发流量切割

1、制作智能 DNS

```

# yum -y install bind
# vim /etc/named.conf
options {
    listen-on port 53 { 127.0.0.1; any; };
    listen-on-v6 port 53 { ::1; };
    directory "/var/named";
    dump-file "/var/named/data/cache_dump.db";
    statistics-file "/var/named/data/named_stats.txt";
    memstatistics-file "/var/named/data/named_mem_stats.txt";

```

```

allow-query { localhost; any; };
recursion yes;
dnssec-enable yes;
dnssec-validation yes;
bindkeys-file "/etc/named.iscdlv.key";
managed-keys-directory "/var/named/dynamic";
pid-file "/run/named/named.pid";
session-keyfile "/run/named/session.key";
};

logging {
    channel default_debug {
        file "data/named.run";
        severity dynamic;
    };
};

view "php" {
    match-clients { 172.25.0.0/16; };
    zone "." IN {
        type hint;
        file "named.ca";
    };
    zone "php-f20.com" IN {
        type master;
        file "php-f20.com.zone";
    };
include "/etc/named.rfc1912.zones";
};

view "jsp" {
    match-clients { 172.25.254.0/24; };
    zone "." IN {
        type hint;
        file "named.ca";
    };
    zone "jsp-f20.com" IN {
        type master;
        file "jsp-f20.com.zone";
    };
include "/etc/named.rfc1912.zones";
};
include "/etc/named.root.key";

#vim /var/named/jsp-f20.com.zone

$TTL 1D
@      IN SOA  ns1.jsp-f20.com. nsmail.jsp-f20.com. (

```

九、实现 mysql 数据库主从复制与读写分离 (M-M-S-S)

master1:172.25.22.16

```

MariaDB [(none)]> grant replication slave on *.* to 'abc'@'%' identified by '123';
Query OK, 0 rows affected (0.00 sec)

```

```

MariaDB [(none)]> flush privileges;
Query OK, 0 rows affected (0.00 sec)
MariaDB [(none)]> show master status\G
***** 1. row *****
File: master1-bin.000002
Position: 458
Binlog_Do_DB:
Binlog_Ignore_DB:
1 row in set (0.00 sec)

```

```

MariaDB [(none)]> change master to
->
master_host='172.25.22.17',master_user='abc',master_password='123',master_port=3306,master_log_fi
le='master2-bin.000001',master_log_pos=458;
Query OK, 0 rows affected (0.43 sec)

```

```

MariaDB [(none)]> start slave;
Query OK, 0 rows affected (0.00 sec)

```

```

MariaDB [(none)]> show slave status\G

```

***** 1. row *****

Slave_IO_State: Waiting for master to send event

Master_Host: 172.25.22.17

Master_User: abc

Master_Port: 3306

Connect_Retry: 60

Master_Log_File: master2-bin.000001

Read_Master_Log_Pos: 458

Relay_Log_File: master1-relay.000002

Relay_Log_Pos: 531

Relay_Master_Log_File: master2-bin.000001

Slave_IO_Running: Yes

Slave_SQL_Running: Yes

master2:172.25.22.17

MariaDB [(none)]> grant replication slave on *.* to 'abc'@'%' identified by '123';

Query OK, 0 rows affected (0.00 sec)

MariaDB [(none)]> flush privileges;

Query OK, 0 rows affected (0.00 sec)

MariaDB [(none)]> change master to

->

master_host='172.25.22.16',master_user='abc',master_password='123',master_port=3306,master_log_file='master1-bin.000002',master_log_pos=458;

Query OK, 0 rows affected (0.25 sec)

MariaDB [(none)]> start slave;

Query OK, 0 rows affected (0.00 sec)

MariaDB [(none)]> show slave status\G

***** 1. row *****

Master_Log_File: master1-bin.000002
Read_Master_Log_Pos: 458
Relay_Log_File: slave2-relay.000002
Relay_Log_Pos: 531
Relay_Master_Log_File: master1-bin.000002
Slave_IO_Running: Yes
Slave_SQL_Running: Yes
```

```
=====
```

```
MySQL-proxy 实现读写分离
172.25.22.15
```

1、安装 mysql-proxy

```
tar -xf mysql-proxy-0.8.5-linux-glibc2.3-x86-64bit.tar.gz
mkdir /mysql-proxy
mv mysql-proxy-0.8.5-linux-glibc2.3-x86-32bit/* /mysql-proxy
```

2、配置 mysql-proxy ,创建主配置文件

```
# cat > /mysql-proxy/mysql-proxy.cnf << EOT
[mysql-proxy]
proxy-address=172.25.22.15:4040
user=root
admin-username=proxy
admin-password=123456
admin-lua-script=/mysql-proxy/lib/mysql-proxy/lua/admin.lua
proxy-backend-addresses=172.25.22.16:3306
proxy-backend-addresses=172.25.22.17:3306
proxy-read-only-backend-addresses=172.25.22.18:3306
proxy-read-only-backend-addresses=172.25.22.19:3306
proxy-lua-script=/mysql-proxy/share/doc/mysql-proxy/rw-splitting.lua
log-file=/var/tmp/mysql-proxy.log
daemon=true
keepalive=true
EOT
```

3、修改读写分离配置文件

```
# vim /mysql-proxy/share/doc/mysql-proxy/rw-splitting.lua
```

```
if not proxy.global.config.rwsplit then
proxy.global.config.rwsplit = {
min_idle_connections = 1,
max_idle_connections = 4,

is_debug = false
}
end
```

4、启动 mysql-proxy

```
# /mysql-proxy/bin/mysql-proxy --defaults-file=/mysql-proxy/mysql-proxy.cnf &
[1] 4753
# netstat -tnpl |grep :4040
tcp 0 0 172.25.20.24:4040 0.0.0.0:* LISTEN 6284/mysql-proxy
```

5、测试读写分离

(1). 在主服务器创建 proxy 用户用于 mysql-proxy 使用,从服务器也会同步这个操作
MariaDB [(none)]> grant all on *.* to 'proxy'@'172.25.22.15' identified by '123456';
Query OK, 0 rows affected (0.03 sec)

MariaDB [(none)]> flush privileges;
Query OK, 0 rows affected (0.02 sec)

(2). 使用客户端连接 mysql-proxy
mysql -u proxy -h 172.25.22.15 -P 4040 -p123456

十、将 web 服务器的数据库连接指向 mysql-proxy

1、修改 php 相关配置文件

```
[root@servere config]# for i in $(find /usr/share/nginx/php-f20.com/ -name '*.php');do grep -q
"172.25." $i && echo $i;done
/usr/share/nginx/php-f20.com/config/config_global.php
/usr/share/nginx/php-f20.com/config/config_ucenter.php
/usr/share/nginx/php-f20.com/uc_server/data/config.inc.php
```

```
[root@servere ~]# vim /usr/share/nginx/php-f20.com/config/config_global.php
$_config['db']['1']['dbhost'] = '172.25.22.15:4040';
```

```
[root@servere ~]# vim /usr/share/nginx/php-f20.com/config/config_ucenter.php
define('UC_DBHOST', '172.25.22.15:4040');
```

```
[root@servere ~]# vim /usr/share/nginx/php-f20.com/uc_server/data/config.inc.php
define('UC_DBHOST', '172.25.22.15:4040');
```

```
[root@servere ~]# systemctl restart nginx
[root@servere ~]# systemctl restart spawn-fcgi
```

2、将修改过的文件同步到另一个节点

```
[root@servere config]# rsync -avzR /usr/share/nginx/php-f20.com/config 172.25.20.15:/
[root@serverf nginx]# systemctl restart nginx
[root@serverf ~]# systemctl restart spawn-fcgi
```

3、修改 jsp 相关配置文件

```
[root@serverg jsp-f20.com]# for i in $(find /usr/local/tomcat/apache-tomcat-8.0.24/jsp-f20.com/ -name '*.xml');do grep -q "172.25." $i && echo $i;done/usr/local/tomcat/apache-tomcat-8.0.24/jsp-f20.com/ROOT/WEB-INF/conf/config.xml
```

```
[root@serverg jsp-f20.com]# vim /usr/local/tomcat/apache-tomcat-8.0.24/jsp-f20.com/ROOT/WEB-INF/conf/config.xml
```

```
[root@serverg ~]# vim /usr/local/tomcat/apache-tomcat-8.0.24/jsp-f20.com/ROOT/WEB-INF/conf/config.xml
```

```
<database maxActive="10" maxIdle="10" minIdle="2" maxWait="10000"
username="runjsp" password="123456"
driverClassName="com.mysql.jdbc.Driver"
url="jdbc:mysql://172.25.22.15:4040/jsp?
characterEncoding=gbk&autoReconnect=true&autoReconnectForPools=true&zeroDate
TimeBehavior=convertToNull"
sqlAdapter="sql.MySqlAdapter"/>
```

```
[root@serverg ~]# service tomcat stop
[root@serverg ~]# service tomcat start
[root@serverg ~]# systemctl restart nginx
```

4、将修改过的文件同步到另一个节点

```
[root@serverg jsp-f20.com]# rsync -avzR /usr/local/tomcat/apache-tomcat-8.0.24/jsp-f20.com/ROOT/WEB-INF/conf/config.xml 172.25.20.17:/
[root@serverh ~]# service tomcat stop
[root@serverh ~]# service tomcat start
[root@serverh ~]# systemctl restart nginx
```
